

Data Sheet

Product Name:	Gilteritinib
Cat. No.:	CS-3885
CAS No.:	1254053-43-4
Molecular Formula:	C ₂₉ H ₄₄ N ₈ O ₃
Molecular Weight:	552.71
Target:	FLT3; TAM Receptor
Pathway:	Protein Tyrosine Kinase/RTK
Solubility:	DMSO : 2 mg/mL (3.62 mM; Need ultrasonic)

BIOLOGICAL ACTIVITY:

Gilteritinib is a potent **FLT3/AXL** inhibitor with **IC₅₀s** of 0.29 nM/0.73 nM, respectively. **IC₅₀ & Target:** IC₅₀: 0.29 nM (FLT3)^[1] IC₅₀: 0.35 nM (LTK), 0.73 nM (AXL), 1.2 nM (EML4-ALK), 230 nM (c-KIT)^[2] **In Vitro:** Of the 78 tyrosine kinases tested, Gilteritinib (ASP2215) inhibits FLT3, leukocyte tyrosine kinase (LTK), anaplastic lymphoma kinase (ALK), and AXL kinases by over 50% at 1 nM with an **IC₅₀** value of 0.29 nM for FLT3, approximately 800-fold more potent than for c-KIT^[1]. Gilteritinib inhibits the activity of eight of the 78 tested kinases by over 50% at concentrations of either 1 nM (FLT3, LTK, ALK, and AXL) or 5 nM (TRKA, ROS, RET, and MER). The **IC₅₀s** are 0.29 nM for FLT3 and 0.73 nM for AXL. Gilteritinib inhibits FLT3 at an **IC₅₀** that is approximately 800-fold more potent than the concentration required to inhibit c-KIT (230 nM). The antiproliferative activity of Gilteritinib is evaluated against MV4-11 and MOLM-13 cells, which endogenously express FLT3-ITD. After 5 days of treatment, Gilteritinib inhibits the growth of MV4-11 and MOLM-13 cells with mean **IC₅₀s** of 0.92 nM (95% CI: 0.23-3.6 nM) and 2.9 nM (95% CI: 1.4-5.8 nM), respectively. Growth suppression of MV4-11 cells is accompanied by inhibition of FLT3 phosphorylation. Relative to vehicle control cells, phosphorylated FLT3 levels are 57%, 8%, and 1% after 2 h of treatment with 0.1 nM, 1 nM, and 10 nM Gilteritinib, respectively. In addition, doses as low as 0.1 nM or 1 nM result in the suppression of phosphorylated ERK, STAT5, and AKT, all of which are downstream targets of FLT3 activation. To investigate the effects of Gilteritinib on AXL inhibition, MV4-11 cells that expressed exogenous AXL are treated with Gilteritinib. At concentrations of 1 nM, 10 nM, and 100 nM for 4 h, Gilteritinib treatment decreases phosphorylated AXL levels by 38%, 29%, and 22%, respectively^[2]. **In Vivo:** In MV4-11 xenografted-mice, the concentration of Gilteritinib (ASP2215) in tumors is more than 20-fold higher than that in plasma with oral administration of Gilteritinib at 10 mg/kg for 4 days. Treatment of Gilteritinib for 28 days results in dose-dependent inhibition of MV4-11 tumor growth and induces complete tumor regression at more than 6 mg/kg. Further, Gilteritinib decreases tumor burden in bone marrow and prolonged the survival of mice intravenously transplanted with MV4-11 cells^[1].

PROTOCOL (Extracted from published papers and Only for reference)

Kinase Assay: ^[2]The kinase inhibitory activity of Gilteritinib is tested against a panel of 78 tested kinases using ATP concentrations that are approximately equal to the **K_m** value for each kinase in a TK-ELISA or off-chip mobility shift assay. Initially, two concentrations of Gilteritinib (1 nM and 5 nM) are tested to assess each compound's inhibitory effect on TK activity. Further studies are then conducted using a dose range of Gilteritinib to determine **IC₅₀** values for kinases in which activity is inhibited by >50% with 1 nM Gilteritinib as well as for c-KIT. TK-ELISA and MSA assays are used to conduct **IC₅₀** studies for FLT3, LTK, AXL, and c-KIT; the HTRF KinEASE-TK assay is performed to assess the **IC₅₀** value of echinoderm microtubule-associated protein-like 4-ALK (EML4-ALK)^[2].

Cell Assay: Gilteritinib is dissolved in DMSO and stored, and then diluted with appropriate media before use^{[1],[2]}The effect of Gilteritinib on MV4-11 and MOLM-13 cells is assessed using the CellTiter-Glo Luminescent Cell Viability Assay. Subsequent studies are conducted to examine the effect of Gilteritinib and Quizartinib on Ba/F3 cells expressing either FLT3-ITD, FLT3-D835Y, FLT3-ITD-D835Y, FLT3-ITD-F691 L, or FLT3-ITD-F691I. **MV4-11 and MOLM-13 cells** are treated with DMSO or increasing concentrations of **Gilteritinib (0.01, 0.1, 1, 10, and 100 nM)** for 5 days, and cell viability is measured using CellTiter-Glo^[2].

Animal Administration: ^[1]Mice^[1]

Antitumor activity is evaluated in nude mice transplanted with MV4-11 AML cells. The pharmacokinetics in xenografted mice is also investigated. **MV4-11 xenografted-mice** are treated with **oral administration of Gilteritinib at 10 mg/kg for 4 days**. Treatment of Gilteritinib for 28 days results in dose-dependent inhibition of MV4-11 tumor growth and induces complete tumor regression at more than 6 mg/kg^[1].
